

Development of retinotopic maps

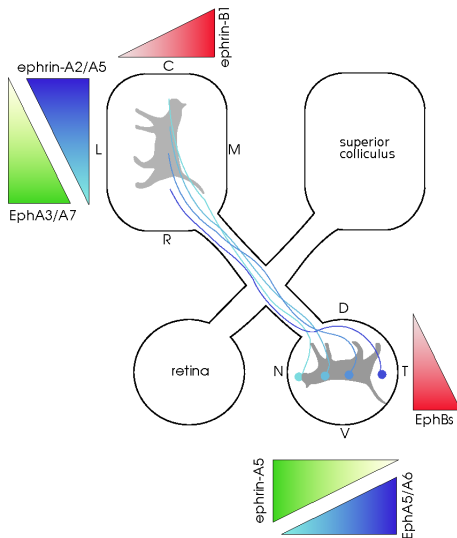

Stephen J Eglen | <http://bit.ly/eglen-nijmegen>

2013-12-10

What is a topographic map?

What is a retinotopic map?

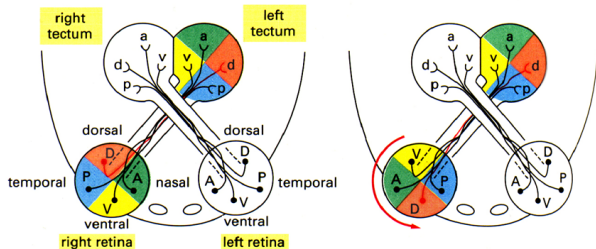

Sperry's experiments

Sperry's experiments:

- 1) Rotation of the eyes of a newt or frog by 180°.
- 2) Cutting of the optic nerves prior to rotation of the eyes by 180°.

In both experiments the animals see their world upside down and back to front. This condition is irreversible.

Result of rotation

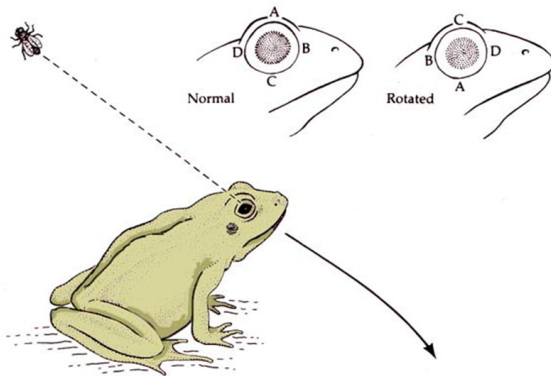

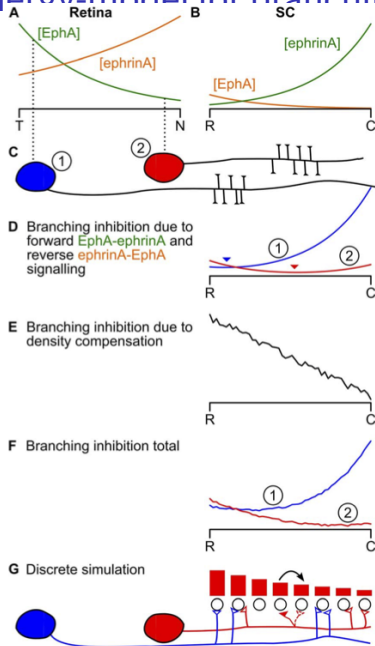

Fig. 21. When the eye is rotated 180° , the frog's prey catching behavior is inverted.
(after Sperry, 1956).

Energy model for branching (Gierer 1987; Sterratt 2013).

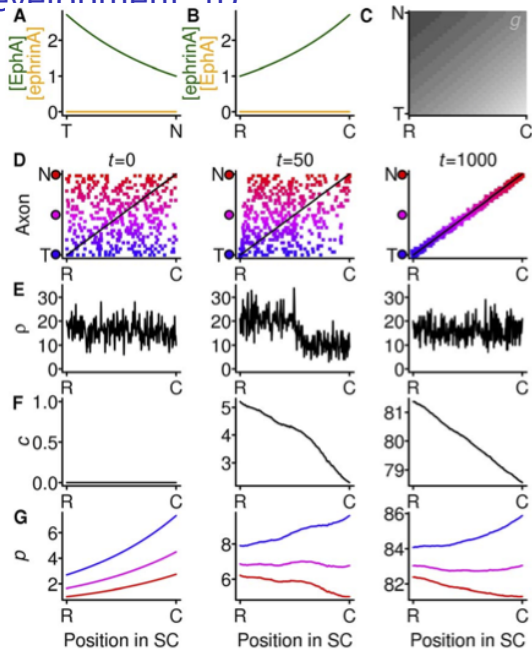

$$g(x, u, t) = [EphA](u)[ephrinA](x) + ephrinA^*(u)[EphA^*](x)$$

$$\frac{dc}{dt} = \epsilon p(x, t) - \eta c(x, t)$$

$$p(x, u, t) = g(x, u, t) + c(x, t)$$

Wild-type development • 1D

Wild-type development: 2D

hello world

(Picture from our 2D simulation).

2 hello world

Activity-based model (Willshaw and von der Malsburg)

Competition brings together lots of models.
